

Supplementary Figure 3. Restricted cubic spline curves for hs-CRP and major adverse cardiovascular events. Restricted cubic spline curves depict adjusted hazard ratios for hs-CRP modeled as a continuous variable in multivariable Cox models. Shaded areas indicate 95% confidence intervals. The vertical dashed line denotes hs-CRP = 2 mg/L, and the horizontal dashed line indicates HR = 1.0. (A) Baseline hs-CRP (mg/L). (B) 1-year (12-month) hs-CRP (mg/L). hs-CRP, high-sensitivity C-reactive protein; HR, hazard ratio.
